

ADJUSTABLE BASEBALL CAP**ABSTRACT OF THE DISCLOSURE**

The invention is an article of headwear that incorporates an adjustment system for accommodating individuals with various head dimensions. The headwear may be formed of a crown and a visor. With respect to the crown, the adjustment system includes a first elastic material, which forms a majority of the crown, and a second elastic material, which is screenprinted or otherwise attached to a flap positioned within the crown. Regarding the visor, the adjustment system resides in a visor board configuration wherein slits are formed to separate various portions of the visor board. The slits permit the portions to move relative to each other, thereby permitting the visor to expand to accommodate stretching of the crown.
